Dynasound's New Cylindrical Raised-Access Floor Masker *Provides Speech Privacy Solutions in Open Structure Architecture*

NORCROSS, GA: Dynasound's new Cylindrical Raised-Access Floor Masker delivers sound masking, voice paging and music signals uniformly – *under air delivery, raised access floor systems*. The cylindrical-shaped masker is placed under the floor and is a mere 4-inches high to facilitate on-going cable management.

The rotary switch is mounted on a 7/8" regressed baffle facing upward – *to prevent damage and to provide ease of installation and servicing*.

Standing waves and metallic resonance are reduced by positioning the speaker 1-3/16" off access, and by using a uniquely-designed acoustical insert. The speaker includes a 1-3/16" diameter secondary cone to increase mid-frequency response for sound masking, voice paging, and music signals.

The transformer taps utilize a seven-position rotary switch that optimizes uniformity and provides better transitions to-and-from sound masked areas. The unit is equipped for pedestal anchoring and is ETL listed to conform with UL 2043 standards for air-handling plenums.

Dynasound, Inc. manufactures the world's largest line of sound masking equipment for use in commercial, defense, government, healthcare and military facilities. For more information, contact Dynasound at 800.989.6275 or www.dynasound.com.
